

RAINBOW

(A composite variety - Opaline Clearwing-Whitewing Yellowface/Goldenface Blue series)

The standard will be as for the Opaline Clearwing-Whitewing Skyblue, Cobalt, Mauve, Violet or Grey except for the following details:

The expression of yellow coloration will vary dependent upon which of the yellowface mutations is visibly present in each case, ie Yellowface Mutant 1 will be lemon yellow, Yellowface Mutant 2 double factor will be buttercup yellow and Goldenface double factor will be deeper yellow. The otherwise white areas of the mask, frontal, crown and the very faintly discernible undulations at the back of the head will be in the shade of yellow coloration appropriate to the Yellowface mutant forms

In this day and age the clear wings on the Rainbow are difficult to find and mostly they have Opaline style colouration which is not desirable

Markings:	on cheeks, back of head and neck will have a light flush of the appropriate shade of yellow visible on the otherwise white areas at the edge of the markings.
Wings:	may have a very light flush of the appropriate shade of yellow visible on the otherwise white areas at the edge of <i>minimal</i> body colour markings.
Primary wing flights:	grey/white.
Primary tail feathers:	neutral with ground or body colour suffusion.
Secondary tail feathers:	blueish/grey at the tip, an overlay of the appropriate shade of yellow on the otherwise white areas is permissible.

NOTE

The notes for the Yellowface and Goldenface mutations regarding the single factor and double factor should also be applied to the written standard for the Rainbow variety.

The Rainbow is not a proper example of the Rainbow variety unless it is visibly an Opaline, a Clearwing-Whitewing and a Yellowface or Goldenface.

This Standard is based on the WBO Standard

Note: In Australia we call them Clearwings, The WBO call them Whitewings.
